

Document for Project

“Food Box – Online food delivery application”

Date 18/Nov/2021

Created By: Sangeetha N

Capstone Project

1. Project and developer details

Project: Food box is a restaurant chain that delivers food items of different cuisines at affordable prices. They have decided launch an online food delivery web application with a rich and user-friendly interface. The system provides different functionalities for admin and non-admin users. Admin user is able to manage products, while any registered user can view menu, select items and checkout the items added to the cart.

Developer: Sangeetha N

2. Sprints planned and the tasks achieved in them

Planned three sprints as below. The sprint's details with the story points are as listed below:

1) Sprint-1:

- Design and Create Database Schema
- Create spring boot application with JWT support for authentication and create user RestAPIs
- Create RestAPI for Add operation for product

2) Sprint-2:

- Create RestAPIs for Edit, Delete and Get operations for product
- Create angular project with support for Signup and login user
- In angular project , add support to view menu to the customer where he can select items
- In angular project, add support to view cart and checkout the cart

3) Sprint-3:

- Add support to view all products for Admin user
- Add support to add/edit/delete product for the Admin user

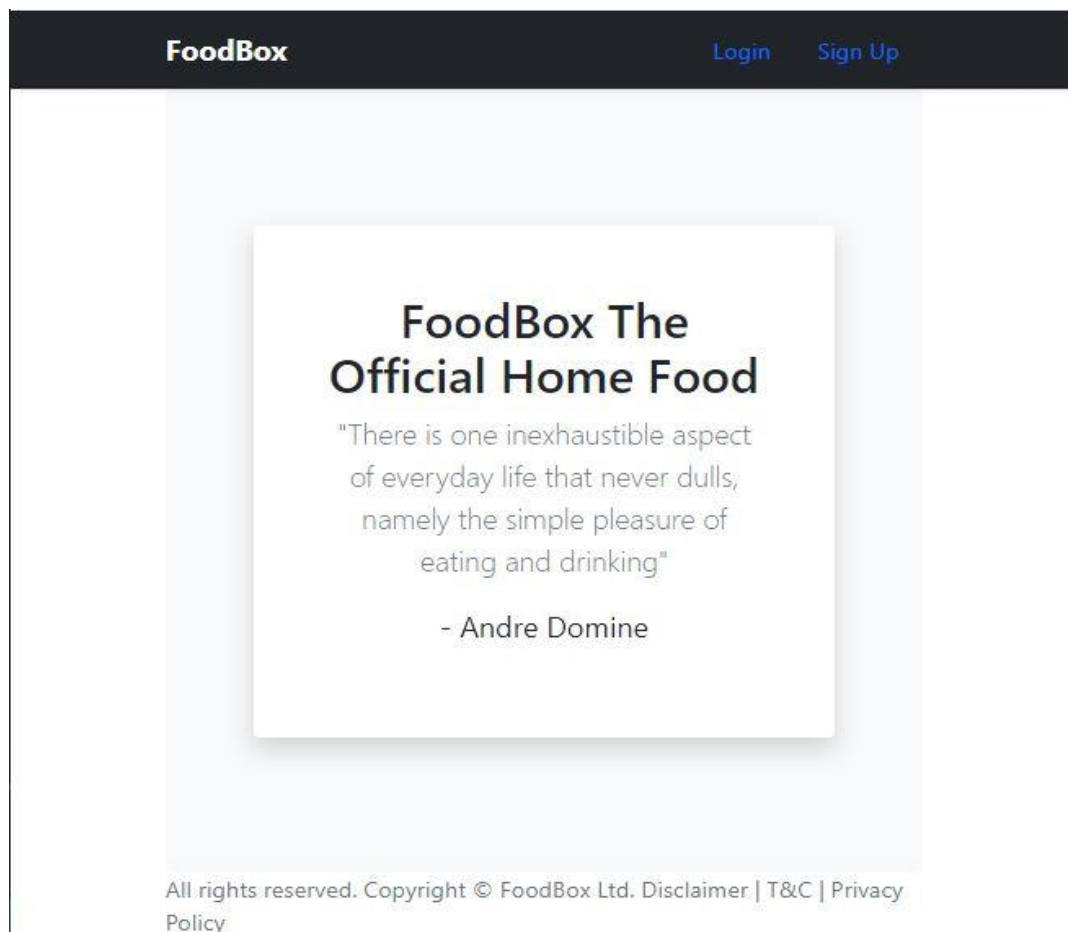

3. Functionalities and Flow of the application

It is a web portal that can be used by Admin user or a non-Admin user. As per the type of user, functionalities are made available to the user. An Admin user has added functionality to “**Manage Products**”, where in the admin can add/delete/edit/view products. All the user need to be first registered with the portal. Then on login both Admin and non-admin user can view “**Menu**” and place the order for food delivery.

All the functionalities are available on the navigation bar to the user. Also links for “**Home**” and “**Log Out**” are provided there.

The functionalities or flows included in the web application from “**Home**” page are as depicted in the below screenshots:

4. Core Concepts and tools used in the project

1. Database management: MySQL
2. Backend logic: Spring Boot, JPA, JWT Authentication, RestAPI
3. Frontend development: Angular, Bootstrap
4. DevOps and production technologies: Git, GitHub, Docker and AWS

5. Link to the GitHub repository

Link to GitHub repository for source code of the project is as below:

<https://github.com/sangeetha-vishwakarma/FoodBox>

6. Conclusion

This application provides interface for admin as well as non-admin users to manage the business data and/or view menu and checkout the order.

Further enhancements can be added to project as:

- Look and feel of the pages can be further enhanced.
- JUNIT5 test cases can be added for all the functionalities.
